

# Poverty and intersecting inequities in access to and utilization of health services: insights from a nationally representative survey

**Achyut Raj Pandey**

**Bergen Centre for Ethics and Priority Setting in Health**

**University of Bergen**

**Authors:** Achyut Raj Pandey, Suman Sapkota, Pratik Khanal, Ravi Kanta Mishra, Kjell Arne Johansson, Shiva Raj Adhikari, Krishna Kumar Aryal

# Contents

**01 Background**

**02 Objectives**

**03 Methods**

**04 Results**

**05 Conclusions**

# Background I

- Distance decay effect in 77% of 108 studies

Access to MNH services can prevent

- 27,116 newborn deaths
- 16,424 stillbirths
- 2,208 maternal by 2030

**Inequities in Access  
to services**

**Inequities in Service  
Utilization**

**Inequities in Health  
Outcomes/Impacts**

health facility

**NMR 26** Among lowest  
wealth quintile  
participants

Difference of two folds

**NMR 13** Among richest  
wealth quintile  
participants

# Objectives

## Objective 1

- To assess the variation in access to and utilization of health services by province, poverty status and urban rural setting

## Objective 2

- To assess how province, poverty and urban rural setting interact with each other to determine access to and utilization of health services

# Methods

## Data sources

- Nepal Living Standard Survey 2022
- Survey undertaken by National Statistics Office

## Sample size and sampling strategy

- A total of 9600 households, representing all seven provinces
- Two stage stratified sampling, with the census enumeration areas (EAs) forming the primary sampling units (PSUs)
- After household listing operation, twelve households were randomly selected from each EA

# Methods

## **Survey Methodology**

- Based on The World Bank's Living Standards Measurement Survey (LSMS) methodology

## **Data management and analysis**

- Descriptive analysis: percentage and mean
- Inferential analysis: Logistic regression

# Methods

## Outcome variable

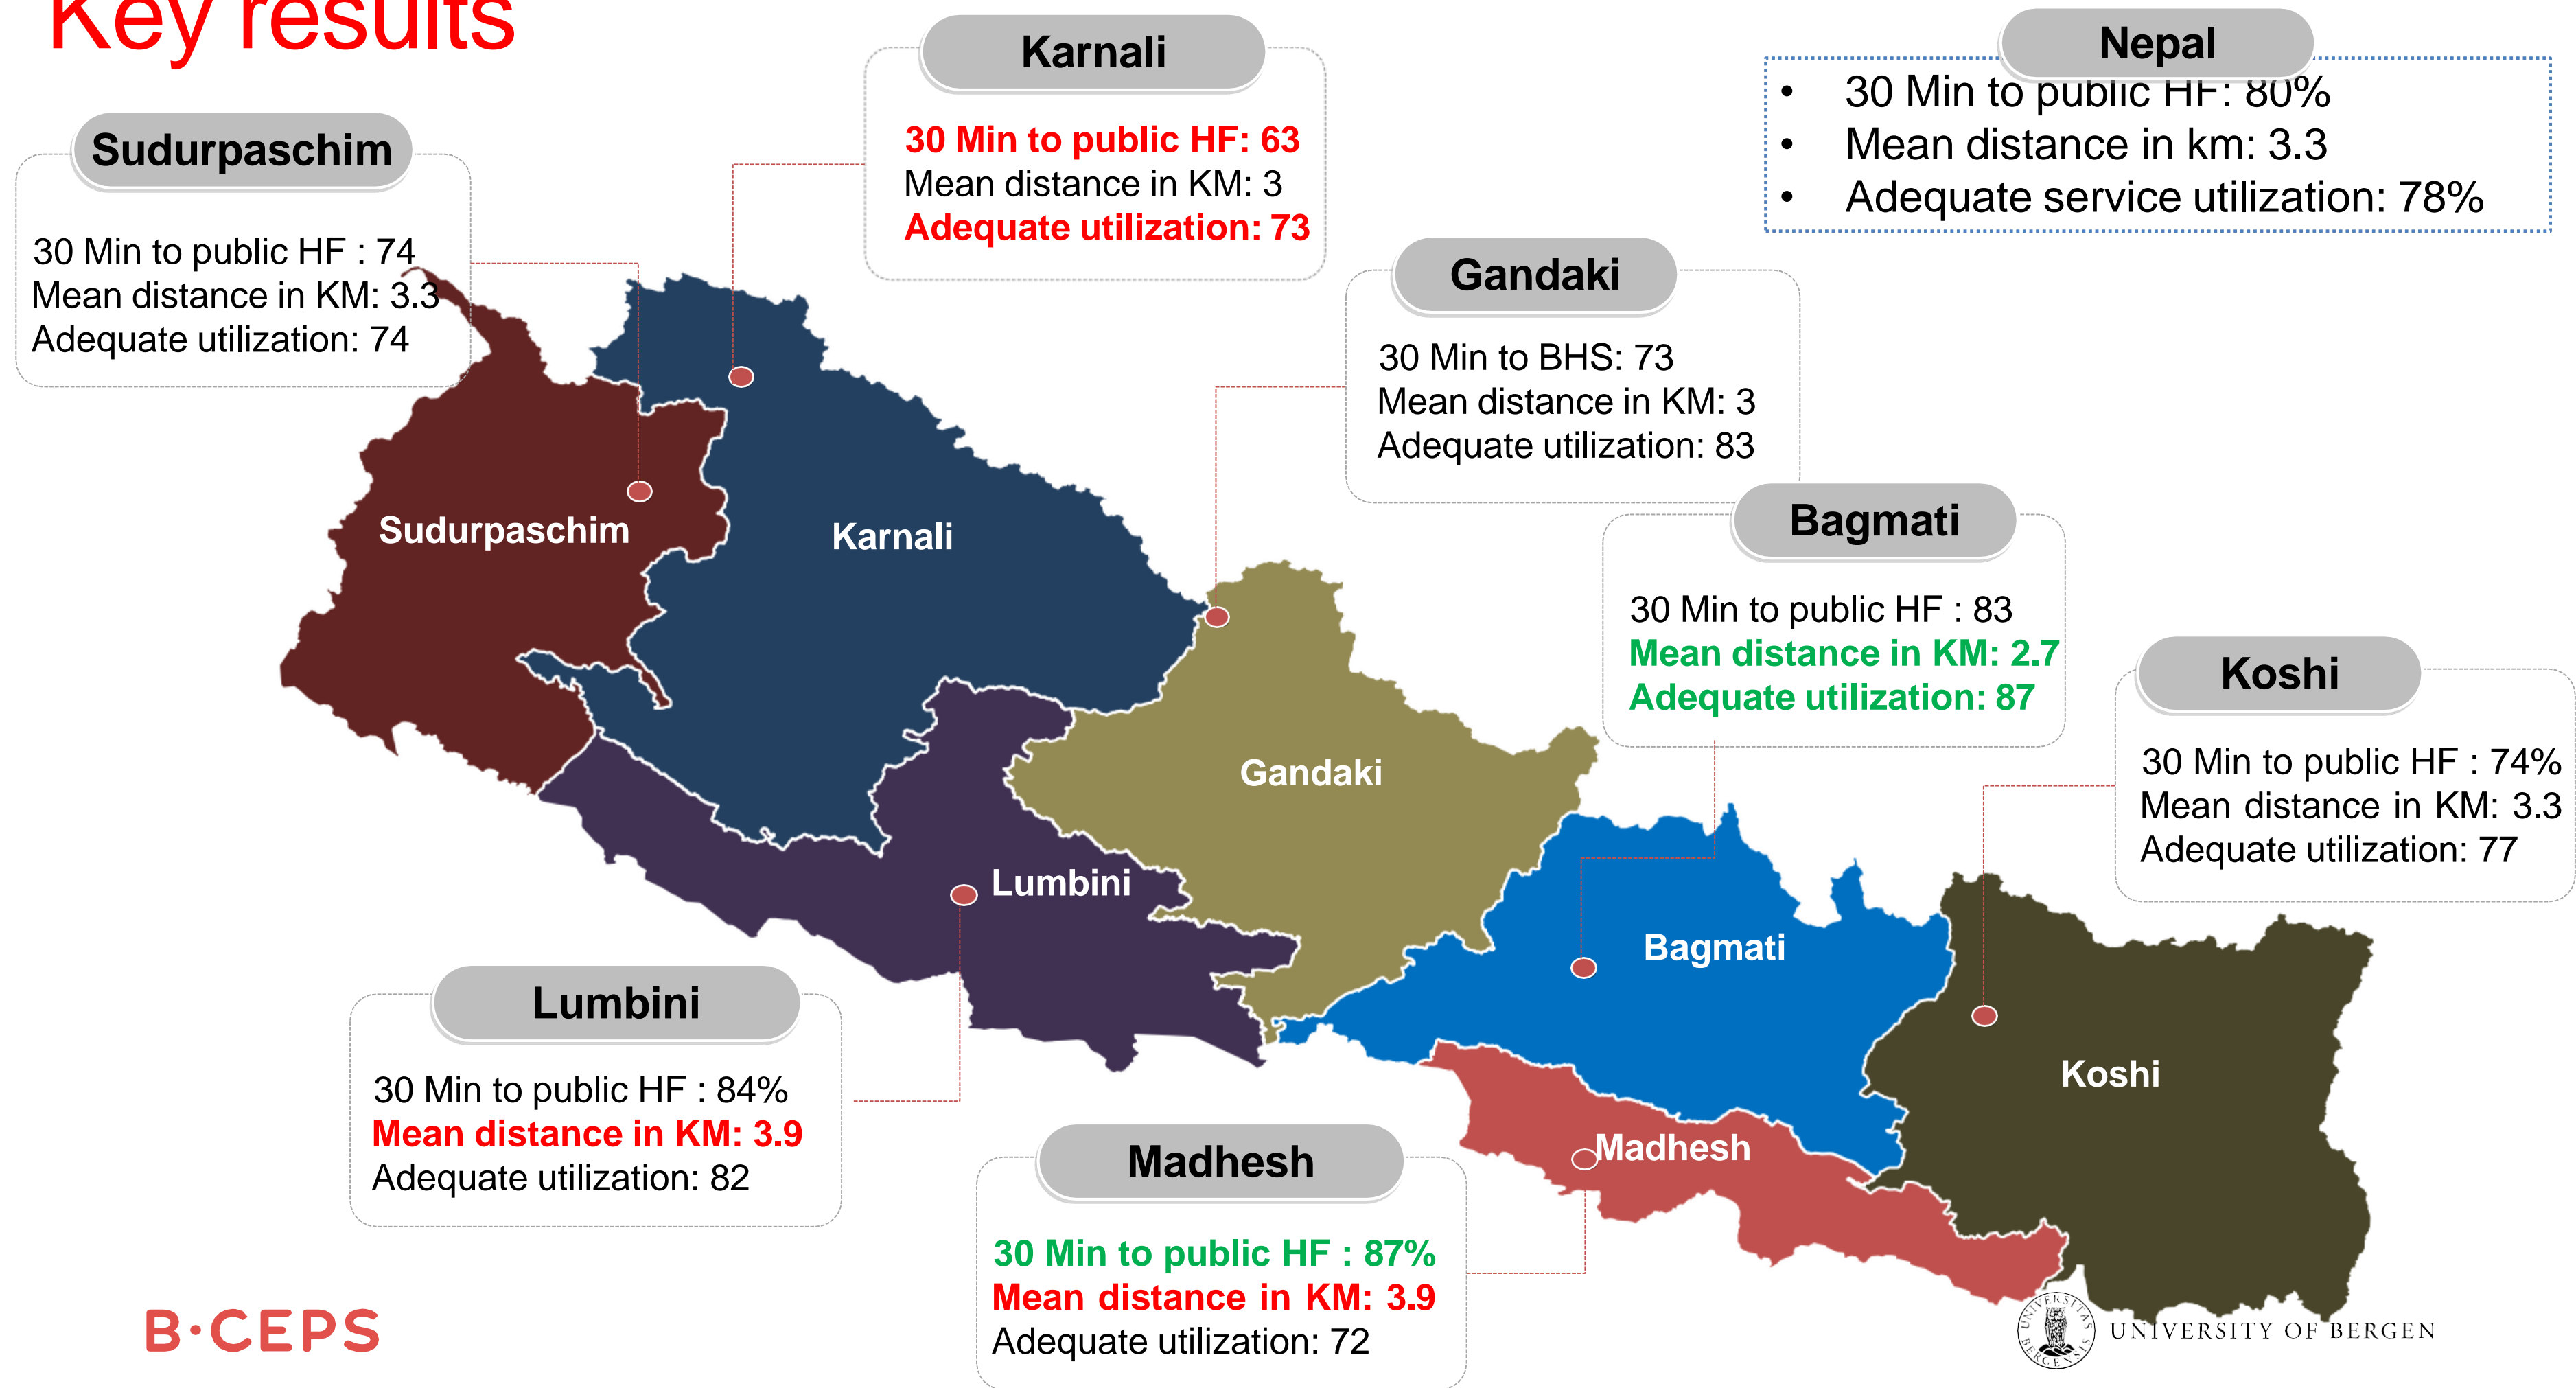

- Access to health facility within 30 min of travel time
- Self reported adequacy of health service utilization

## Intersecting variables

- **Province:** Seven provinces as outlined in Constitution of Nepal
- **Poverty:** Considers revised official poverty line of estimated at NRs. 72,908 per person per year set in 2022 23. This represents the aggregate of the food and the non food poverty lines.
- **Urban/Rural setting:** As per standard classification, rural municipality classified as rural setting while metropolitan, sub metropolitan and urban municipalities classified as urban setting.

# Key results

# Key Results

## Urban

- 30 Min to public HF : 86
- Mean distance in KM: 2.72
- Adequate utilization: 82

## Rich

- 30 Min to public HF : 82
- Mean distance in KM: 3.2
- Adequate utilization: 84

## Rural

- 30 Min to public HF : 65
- Mean distance in KM: 4.7
- Adequate utilization: 73

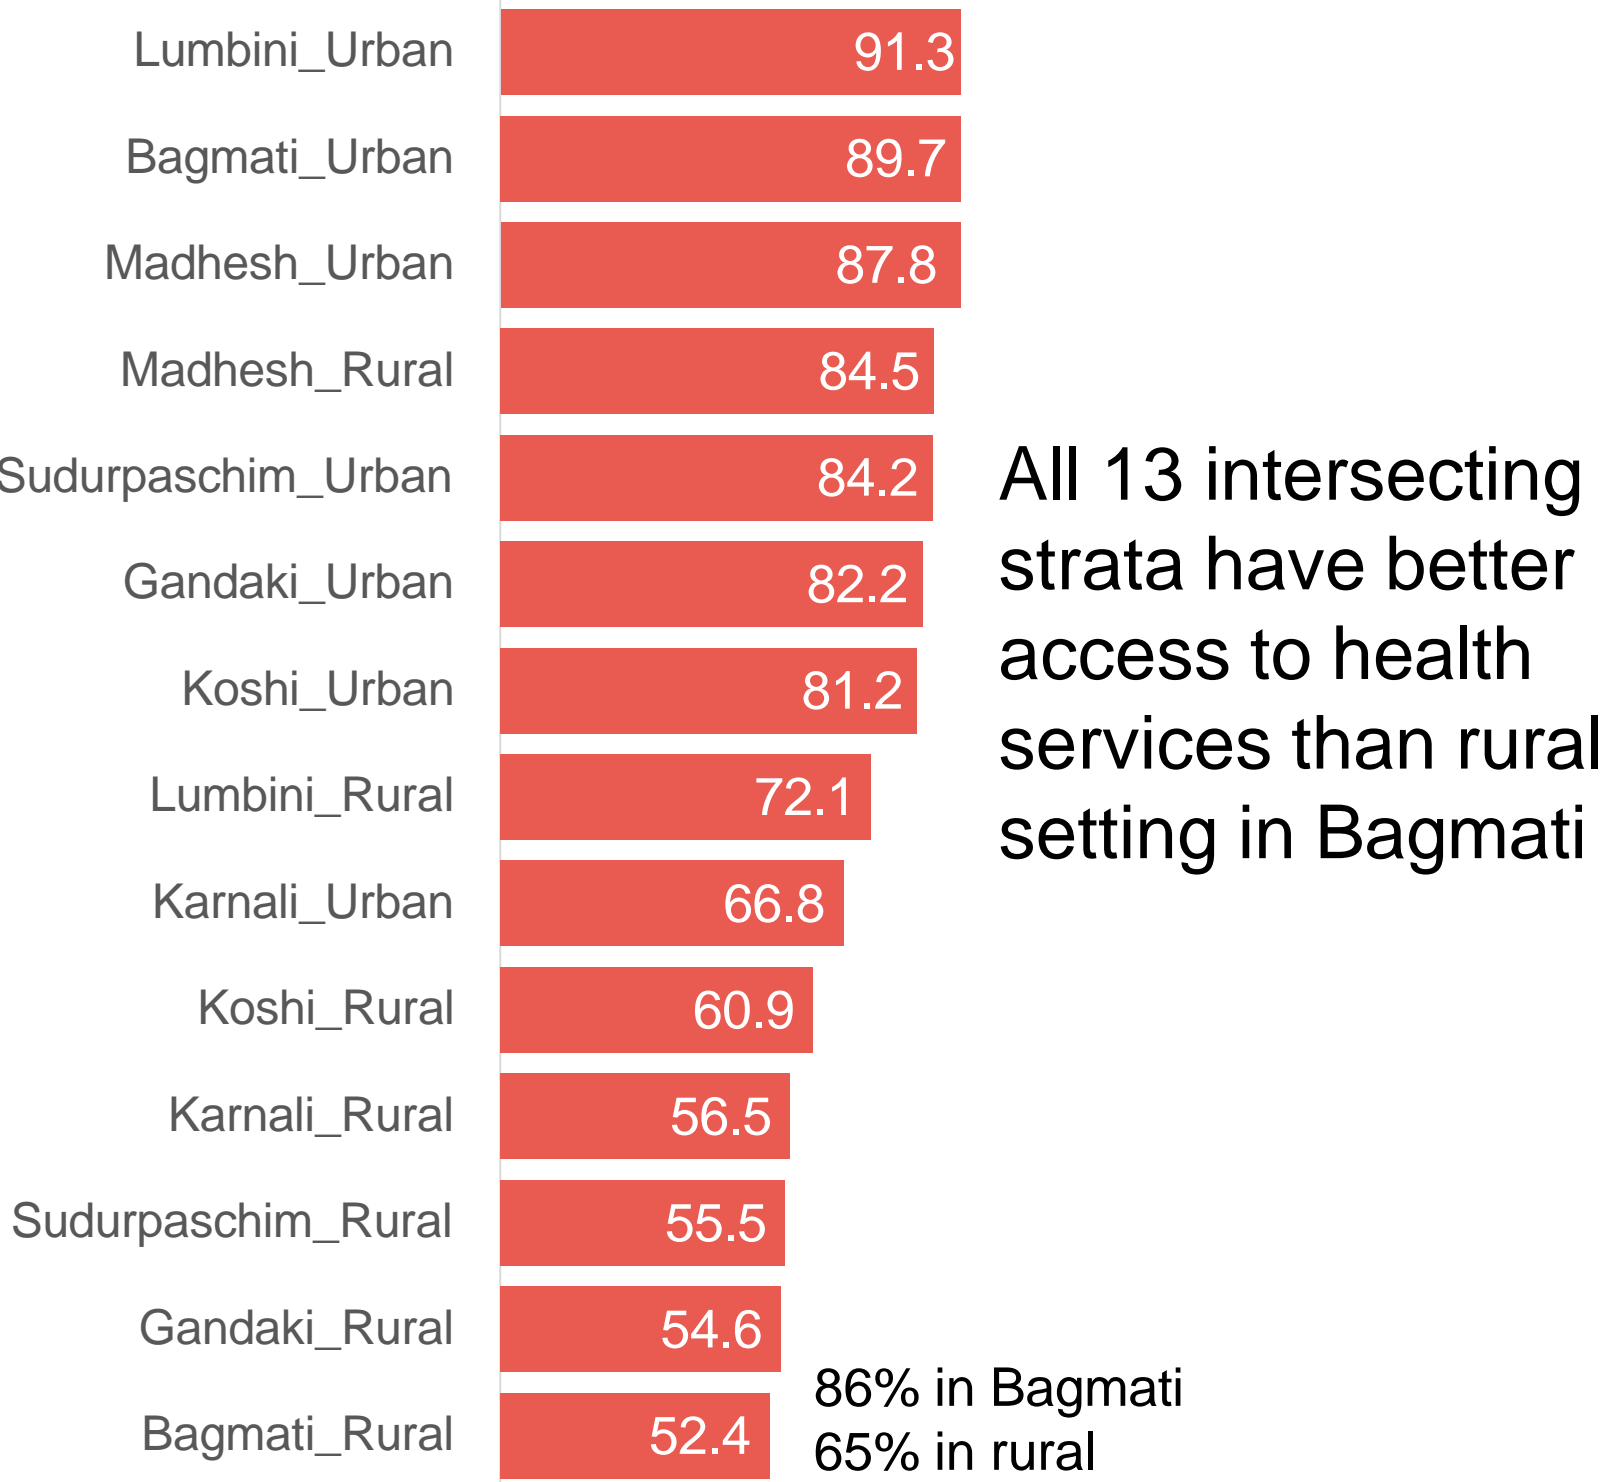

## Poor

- 30 Min to public HF : 68
- Mean distance in KM: 4.8
- Adequate utilization: 57

# Conclusions

01

Inequities become more severe when more than one form of marginalization co occur.

02

Upto 3 folds difference in proportion of people reaching health facility within 30 min of travel time.

01

Despite policy commitment, half of population in rural setting of four provinces (out of seven) can not reach health facilities within 30 min.

02

Blanket approach of setting up infrastructure and expanding them may not be useful

# Take home message

01

Drawing inference based on only one factor could lead to misleading conclusions

02

Blanket approach of setting up infrastructure and expanding them may not be useful from equity perspective. Need to consider intersectionality
